Fabric Accumulator Spindle Driven Accumulator M210-30

The roller accumulators are preferably used for synchronizing a continuously operating production range and a discontinuously operating winder respectively unwinder at batch change. Such the accumulator picks up the running fabric lane whilst the fabric behind the spindle driven accumulator has to be stopped.

The execution of this kind of roller accumulator guarantees a very precise fabric run. The machine can be designed both as accumulator in comb design meaning a simple drawing-in of the fabric and in space saving non-comb execution.

A sensitive tension adjustment inside the roller accumulator is ensured upon feeding as well as emptying depending on the material.
